## HELP IT GROW...USE H<sub>2</sub>O

The fall is the time for cultivating new turf. Your lawn has received *Aeration & Seeding Services*. Your turf will require watering to ensure the successful establishment. Newly germinated seedlings require *daily* supplemental water for the first *(30) thirty days* after seed germination. The area must be

thoroughly watered for *(20-30) minutes* to provide constant surface moisture. Days with higher temperatures may require additional watering. After *(1) one* month, watering should continue to provide *at least (1) one inch* of rain per week in combination with rainfall levels for the remainder of the growing season (thru end of November/begin of December).

Morning is the preferred time to water. Other times of the day will promote "burning" of the turf and/or promote the spread of various turf fungi and diseases. These are only guidelines and are to be continually adjusted according to weather, soil composition, and seasonal conditions.

### GENERAL RULE OF THUMB

90° + = 4 Times per Week  
70° - 90° = 3 Times per Week  
50° - 70° = 2 Times per Week
